

In this application we want to help people get their items irrelative with specific time. We want to build a platform where everybody will help achieve each other's goals with less money and time cost. There will be two kinds of users:

1) Sender & Receiver

2) The person who carries the item that was requested.

The exchanging-item process starts when a person who wants to receive an item requests for a particular item to be received and defines source and destination in the application. Then the person who wants to send an item has to accept the offer if a particular request for an item matches the circumstances of a sender. The sender:

for example, has received a request from Karachi for an item but he is currently in Lahore and within a couple of days he is about to leave for Karachi he can accept the offer and defines when will he be there to have the receivers item delivered then if the person who pose/post the requests for an item agrees the criteria of sending and receiving an item and if the amount of money that the sender charges is satisfied by the receiver. The deal gets done. And they both exchange a verification code with each other so that they could have a validation of having trust between each other. Then comes the role of carrier who will carry a particular item and then receiver has to pick his item from there without any cost. Item exchanging this way will create a win-win situation for everybody.

The sender gets the amount of money for bringing along with him the item he finds feasible to pick along with him. The receiver gets the item without any time constraints even there is a golden opportunity for the receiver that without having to wait for three or four days he has thousands of people who are traveling each day which eventuates as thousands of opportunities to have his item delivered on any day he wants to have it. Carrier earns money with almost doing nothing but just a sort of reception, we will pay the carrier from our company's profit.
